

What This Model Is Not

A clarification note to avoid misunderstandings

This document outlines what the Projective Informational Framework (MPFM) does not claim to be.

Its purpose is to prevent misinterpretation, overstatement, or inappropriate comparison with existing physical theories.

The model should be read as a structural framework, not as a competing “theory of everything.”

1. This is not a replacement for quantum mechanics

The MPFM does not:

- modify the Schrödinger equation,
- alter quantum amplitudes or operators,
- replace Hilbert space formalism,
- propose new particles or forces.

Quantum mechanics remains fully valid within its domain.

The MPFM addresses a prior question:

Why do quantized, stable entities and probabilistic laws exist at all?

It does not compute spectra, cross sections, or scattering amplitudes.

2. This is not an alternative to general relativity

The MPFM does not:

- modify Einstein's field equations,
- introduce extra dimensions or hidden fields,
- alter local relativistic predictions,
- propose violations of equivalence principles.

General relativity remains the correct description of spacetime dynamics.

The MPFM provides a conceptual interpretation of:

- mass,
- gravity,
- horizons,
- cosmological constant
as emergent from informational projection.

3. This is not a new “information = bits” theory

The model does not:

- identify physical reality with digital bits,
- reduce physics to Shannon entropy,

- assume computation as a substrate of the universe.

Information here is structural and relational, not digital, algorithmic, or observer-dependent.

No discretization of reality is assumed.

4. This is not a consciousness or mysticism theory

The MPFM does not:

- claim that consciousness collapses reality,
- introduce mind-dependent physics,
- support panpsychism or metaphysical idealism.

Consciousness is treated as:

a high-level informational attractor,
not as a fundamental constituent of physics.

No metaphysical claims are made.

5. This is not a numerological framework

The MPFM does not:

- fit constants to observed values,
- claim to compute all dimensionless numbers,
- rely on coincidence or pattern-matching.

When constants are discussed:

- their status (derivable / constrained / non-calculable) is explicitly stated,
- no free parameters are hidden,
- failed derivations are acknowledged.

6. This is not a theory with guaranteed predictions

The MPFM does not promise:

- spectacular new particles,
- immediate experimental confirmation,
- falsification of standard models.

It proposes interpretive and structural predictions, some of which may be:

- subtle,
- indirect,
- long-term.

The model explicitly accepts the possibility of future falsification.

7. This is not a complete theory of everything

The MPFM does not claim to:

- unify all interactions dynamically,
- replace existing calculational frameworks,
- close all open problems in physics.

It is a meta-framework that addresses:

- why laws exist,
- why stable structures emerge,
- why time and causality appear.

8. What this model is

For clarity, the MPFM is:

- a structural framework, not a gadget theory,
- a minimalist ontology based on information and projection,
- compatible with existing physics,
- falsifiable in principle,

- open to refinement or abandonment.

Final statement

This model does not claim to explain everything.
It claims to explain why anything explainable
exists at all.

Any use beyond this scope is a misunderstanding.
